Practical NO : 09

Aim : transfer file between system in LAN using FTP configuration.

Software required :- Cisco packet tracer

Theory :-

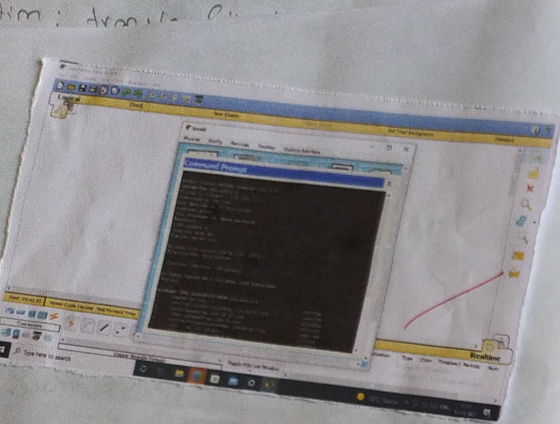

File transfer protocol (FTP) :-

It is an internet protocol provided by TCP/IP. The first feature of FTP is developed by Abhay Bhushan in 1971. it help to transfer file from one computer to another by providing access to directories.

The FTP connection is established between two systems and they communicate with each other using a network so for the connection the user can get permission by providing the credentials, to the FTP server or can use anonymous FTP.

The command channel is used to transfer command and responses from client to server and server to client.

P

Date _____

Page No. _____

procedure :-

- (i) in server create a one file in this local storage.
- (ii) on the ftp service of server and set credential and give full access to account and add all this.
- (iii) using command prompt - check file is created present or not in server local storage.
- (iv) To add a file from local storage to ftp storage run ftp command with server IP and give username and password. after that type put command with filename.txt and check file is transfer in ftp or not.
- (v) In client side. login in server IP and provide username and password. then run get command with filename.txt and check the file access is get by client or not using 'dir' command. If filename.txt file present in client directory then we successfully get the file from server.

Conclusion : we have studied about transfer file between system in using FTP configuration.
